The clinically organ-confined adenocarcinoma of the prostate: Natural history, selection criteria for radical prostatectomy and prognostic factors based ... (Fortschritte der Urologie und Nephrologie)

Dr. Hans-Peter Schmid has addressed in this monograph the basic dilemmas surrounding prostate cancer.

These dilemmas include the 40 % histologic incidence of invasive cancer in men in comparison to a 3 %

death rate, the extraordinary slow doubling time of four to five years for untreated early clinical stages (T

and T2 cancers), the limited life span of even healthy men over 70 years of age, and the national and

international debates of how to treat this cancer. It is important, however, to recognize that despite these

uncertainties, prostate cancer is probably the most predictive of all human solid tumors. Dr. Schmid has

addressed the basis for much of this predictability in this monograph. The level of serum PSA and its rate

increase in the untreated patient with a prostate size of less than 50 grams is undoubtedly the most useful

all measurements in predicting volume and grade of the cancer, but it is closely followed by assessment of

the extent and percent of grade 4 and 5 cancer in six systematically, spatially separated biopsies. Estimating

amount of suspected cancer on digital rectal examination by assigning a clinical stage is useful, but far less so in the PSA era, as this is done. The Rule of 10 is a useful rule of thumb for this.

quantitative than PSA and systematic biopsies. The Basel series in this monograph adds strong support to this claim.

these basic concepts. April 1994 Thomas A. Stamey, M. D. Professor and Chairman Department of Urology, Stanford University School of Medicine, Stanford, California, USA • Content Professor
