From Basic Immunology to Immune-Mediated Demyelination (Topics in Neuroscience)

Morphological, physiological and pathological evidence demonstrates that nervous and immune systems interact not only in maintaining brain homeostasis, but also in causing neurological diseases. The study of these interactions represents the basis on which neuroimmunology has grown during the years. At present, several neurological diseases are recognized to be caused by a derangement of the immune system in either its regulatory or effector functions. The main scope of this book, to discuss how an unbalanced immune system may lead to immune-mediated neurological diseases, is achieved in three parts. The first part provides an overview on how the immune system works. This is propaedeutical to understanding interactions between the immune and nervous systems, which are discussed in the second part. The third part of the book focuses on one particular area of neuroimmunology, the immune disorders leading to the damage of central and peripheral myelin. Given the opportunity to review first the immune system in itself and then how it operates during immune-mediated demyelinating disorders, we have tried to provide the reader with a basis for clearly understanding how interactions between the immune and nervous systems can be protective or pathogenic. This knowledge is a prerequisite for a rationale immune intervention targeting these disorders.
